

REPROLINE 754

Utilisation

Developer concentrate for image setter films which will be exposed with Argon-ions, Helium-Neon- and infrared lasers. A high stability of the development can be achieved with high maximum density. Line and daylight-films can also be developed with excellent results. This developer contains additives against oxidation and deposit in the developer tank.

Preparation

Dilution: 1 + 3

30 litres water + 10 litres concentrate make 40 litres of ready-to-use developer or replenisher

The replenisher in the replenishing tank has to be used up within 2 weeks.

Development conditions

The following development conditions will be recommended:

Developer temperature: °C 32 35 38

Developing time: s 35 30 25

As per daylight-films the recommended temperatures/times should not be exceeded.

Replenishment

The replenishment rate for an average working condition (about 5 m² / workingday) amounts to 200 ml/m².

Packaging

REPROLINE 754

10 litres concentrate in PE-cans.
