

REPROLINE 71 P

Utilisation

A 1 Part powder regenerator with universal properties for line, contact and daylight-films. This developer works very cleanly with a low fog level and a very high stability. Contains additives against oxidation and deposit. This 1 Part powder mixture is vacuum-packed and therefore disposes of an excellent storage stability.

Preparation

A bag will be diluted in 19,4 litres of water to get 20 litres ready-to-use developer or regenerator.

We recommend automatic mixers (i.e. **Tetenal Powdermix** or **Variomix II**).

To avoid dust formation the bag will be emptied with the extended end underneath the water surface.

The replenisher in the replenisher tank has to be used up within 2 weeks.

Developing conditions

The following developing conditions will be recommended:

Developer Temperature	°C	32	35	38
Developing Time:	s	35	30	25

Replenishment

The replenishment rate for an average working condition (about 5 m²/working day) amounts to 200 ml/m²

Packaging

REPROLINE 71 P

Carton for 4 x 20 litres ready-to-use developer

Art.-No. 106365
